

## **Lab 03 Tasks**

### **Task 1:**

Write a C++ program which take the number from the user and create a dynamic array having size of a given number. This program then should print only all the even numbers. After printing, the program must free up the memory allocated to that array.

### **Task 2:**

Write a C++ program which extends the first task in a way that take two numbers from the user, called min and max. First the program creates the array to the size of min number and print the given numbers. After that, it dynamically resizes the array to the max number and print all the number up to the max number.
